Installing the NVIDIA GeForce GTX 1080 Ti graphics card hardware involves opening your computer. Follow all the safety instructions provided here to ensure that there is no damage to you, your computer, or the graphics board.

**Safety Instructions**

To reduce the risk of fire, electric shock, or injury, always follow basic safety precautions.

*Note:* All hardware must be installed prior to installation of the drivers.

- Remove power from your computer by disconnecting the AC main source before installation.
- Do not operate this product near water or when your hands or body are wet.
- Do not place this product on soft surfaces that could block the ventilation slots and cause overheating.
- Do not place this product near a heating register or radiator.
- Place this product securely on a stable surface. Serious damage to this product may result if it falls.
- Do not allow anything to rest on the power cord. Do not place this product where a person can step or trip on the power cord.
Before You Begin

The GeForce GTX 1080 Ti graphics card is a PCI Express 3.0 ×16 graphics card. Your computer may already have a graphics card installed in the PCI Express slot. If so, you will need to remove that graphics card and replace it with the GeForce GTX 1080 Ti graphics card.

If you do not have a graphics card, this means that your motherboard has on-board graphics (there is a graphics chip installed on your motherboard or integrated in the motherboard chipset). If this is the case, there is no action that needs to be taken before installing your new graphics card.

Installing the GeForce Graphics Card

Because there are so many different computer systems on the market, the procedure to install the GeForce GTX 1080 Ti graphics card can vary from system to system. Use the following instructions as a guideline and consult the documentation for your computer system for any further information on your individual system.

Note: It is important that all power to the computer be disconnected before you install the graphics card.

Discharge your body’s static electricity by touching a grounded surface before touching the graphics card. A grounded surface is the computer chassis, or some other surface you know to be grounded.

Use the following procedure to install the GeForce GTX 1080 Ti graphics card into your computer system.

1. Turn off your computer and monitor and disconnect the power cord. Depending on your computer system, you may need to disconnect the cable going to the back of your system. Mark the cables so you can make sure you reconnect them properly.

2. Open your computer by removing the cover/side panel. Refer to your computer documentation from the original manufacturer for assistance.

3. Remove any existing graphics card (if there is one). Save hardware (such as screws and brackets) to use when installing the NVIDIA graphics card.
**ATTENTION:** If your system has been running for a while prior to opening the panels, it is very important that you wait until the graphics card in your system has cooled before taking the card out of the system. Graphics cards get very hot when they have been operating for any length of time.

4. Remove two adjacent slot covers if you do not have a graphics card installed.

![Image showing removal of slot covers]

Remove two adjacent slot covers that corresponds to the PCI-Express slot you are installing the GeForce GTX graphics card in.

**Note:** The GeForce GTX 1080 Ti card is double-wide and will require removing two slot covers.

5. Plug the GeForce GTX 1080 Ti graphics card into the Primary PCI Express x16 slot on your motherboard. This is often the slot closest to the CPU but may be the second or third slot. Look for the slot labeled x16. It will likely be the only PCI Express slot with a retention lever on the end of the slot or the one closest to the CPU.

![Image showing installation of GeForce GTX card]

Install your first GeForce GTX 1080 graphics card into the Primary PCI Express x16 slot.

**Note:** It is recommended that you install the graphics card into the primary PCI Express x16 slot. If you install the graphics card into the secondary slot, your system may not recognize the graphics card and there will be nothing displayed on the monitor.

Also note that on some motherboard SBIOS, the physical location of the primary slot can be configured when there are more than one PCI Express x16 slots.
If you are installing additional GeForce GTX 1080 Ti graphics cards for a 2-way SLI configuration, continue with step 6. If you are only installing one GeForce card, go on to step 7.

**Note:** All of the graphics cards in an SLI configuration must be identical. Therefore, both cards in a 2-way SLI configuration must be GeForce GTX 1080 Ti graphics cards.

6 Install a second GeForce GTX 1080 Ti graphic card [2-way SLI]:
Install the second GeForce card into the outer most PCI Express x16 slot on the motherboard.

Connect the two GeForce GTX 1080 Ti cards together using the dual SLI bridge connector that came with your SLI-ready motherboard.

**Note:** For 4 K and surround gaming performance, use the NVIDIA dual-link SLI bridge available from [http://www.geforce.com/hardware/technology/sli](http://www.geforce.com/hardware/technology/sli) and select NVIDIA SLI Bridge. There are three sizes available depending on which slot you choose to put the second card.
7 Connect a 6-pin and 8-pin power connectors from the power supply to the power connectors on the top edge of the GeForce GTX 1080 Ti graphics card. Note that the connector and socket on the graphics card have a unique shape and connect one way only.

Reinstall the cover on your computer and reconnect any cables that you removed earlier in the installation.
With the hardware installed, it is now time to install the GeForce Experience software and the graphics driver.

**GeForce Experience Software Installation**

1. Download and install GeForce Experience software.
   - Go to [http://www.geforce.com/geforce-experience/download](http://www.geforce.com/geforce-experience/download) and click Download Now.
